

Variant O HMM-posterior $p_{volatile}$: simple GaussianHMM vs current BIC-winner

Variant O — refit as plain GaussianHMM (n_mix=1, no BIC sweep) — 33% of test days have $p_{vol} > 0.5$

Variant O — currently saved (BIC-winner: GMMHMM, n_mix=2) — 67% of test days have $p_{vol} > 0.5$
